June 13, 2021 6:42pm

We define $\overline{\mathcal{X}_k}$ to be a point in $\mathcal{X}_k$ such that

$$f(\overline{\mathcal{X}_k}) = \min\{f(x) : x \in \mathcal{X}_k\}. \tag{0.1} \texttt{?eq:xopt?}$$

If multiple points attain the minimum, then we take the earliest one visited by the algorithm.

$$\delta(\mathcal{X}_k) = \max\{\|x - \overline{\mathcal{X}_k}\| : x \in \mathcal{X}_k\} \tag{0.2} \texttt{?eq:xdist?}$$

$$\mathcal{Q}_k = \{Q \in \mathcal{Q} : Q(x) = f(x) \text{ for } x \in \mathcal{X}_k\}, \tag{0.3} \texttt{?eq:quak?}$$

and, similarly, $\mathcal{Q}_k^+ = \{Q \in \mathcal{Q} : Q(x) = f(x) \text{ for } x \in \mathcal{X}_k^+\}$.

$$\|Q\|_{\mathrm{S}} = \|\nabla^2 Q\|_{\mathrm{F}} \tag{0.4} \texttt{?eq:snorm?}$$

$$\mathrm{P}_{\mathcal{C}}^{\mathrm{S}}(\Phi) = \operatorname{argmin}\{\|Q - \Phi\|_{\mathrm{S}} : Q \in \mathcal{C}\}$$

Algorithm 0.1 OPTimization based on Interpolation Models (OPTIM)

Input $\Delta_0 \in (0, +\infty)$, $\tau > 0$, $m \in \{1, 2, \ldots, (n+1)(n+2)/2\}$, and $\mathcal{X}_0 \subset \mathbb{R}^n$ with $|\mathcal{X}_0| = m$ and $\kappa(\mathcal{X}_0) \leq \kappa_0$. Set $k = 0$.

1. **Model construction**. Pick $Q_k \in \mathcal{Q}_k$.

2. **Trust-region step evaluation**. Calculate

$$x_k^{\mathrm{a}} \approx \arg\min\{Q_k(x) : \|x - \overline{\mathcal{X}_k}\| \leq \Delta_k\}. \tag{0.5} \text{?\underline{eq:xadd}?}$$

   If $\|x_k^{\mathrm{a}} - \overline{\mathcal{X}_k}\| < \alpha\Delta_k$, then set $\Delta_{k+1} = \theta\Delta_k$; otherwise, update Δ_k to Δ_{k+1} according to $r_k = [f(\overline{\mathcal{X}_k}) - f(x_k^{\mathrm{a}})]/[Q_k(\overline{\mathcal{X}_k}) - Q_k(x_k^{\mathrm{a}})]$.

3. **Interpolation set update**. Let

$$x_k^{\mathrm{d}} \approx \arg\min\{\kappa(\mathcal{X}_k \cup x_k^{\mathrm{a}} \setminus x) : x \in \mathcal{X}_k\}. \tag{0.6} \text{?\underline{eq:xdrop}?}$$

   If $\|x_k^{\mathrm{a}} - \overline{\mathcal{X}_k}\| \geq \alpha\Delta_k$ and either $r_k > \eta_0$ or $\kappa(\mathcal{X}_k \cup x_k^{\mathrm{a}} \setminus x_k^{\mathrm{d}}) \leq \kappa_0$, then set $\mathcal{X}_{k+1} = \mathcal{X}_k \cup x_k^{\mathrm{a}} \setminus x_k^{\mathrm{d}}$.

4. **Geometry improvement**. If $\|x_k^{\mathrm{a}} - \overline{\mathcal{X}_k}\| < \alpha\Delta_k$, or if $r_k \leq \eta_0$ and $\kappa(\mathcal{X}_k \cup x_k^{\mathrm{a}} \setminus x_k^{\mathrm{d}}) > \kappa_0$, then set $\mathcal{X}_{k+1} = \mathcal{X}_k \cup y_k^{\mathrm{a}} \setminus y_k^{\mathrm{d}}$ with

$$y_k^{\mathrm{d}} = \arg\max\{\|y - \overline{\mathcal{X}_k}\| : y \in \mathcal{X}_k\}, \tag{0.7} \text{?\underline{eq:ydrop}?}$$

$$y_k^{\mathrm{a}} \approx \arg\min\{\kappa(\mathcal{X}_k \cup y \setminus y_k^{\mathrm{d}}) : \|y - \overline{\mathcal{X}_k}\| \leq \Delta_k\}. \tag{0.8} \text{?\underline{eq:yadd}?}$$

Algorithm 0.2 NEWUOA

Input $\Delta_0 \in (0, +\infty)$, $\tau > 0$, $m \in \{n+2, n+3, \ldots, (n+1)(n+2)/2\}$, and $\mathcal{X}_0 \subset \mathbb{R}^n$ with $|\mathcal{X}_0| = m$ and $\kappa(\mathcal{X}_0) \leq \kappa_0$. Define $Q_0 = \mathrm{P}^{\mathrm{s}}_{\mathcal{Q}_0}(0)$. Set $k = 0$.

1. **Trust-region step evaluation**. Set

$$x_k^{\mathrm{a}} \approx \mathrm{argmin}\{Q_k(x) : \|x - \overline{\mathcal{X}_k}\| \leq \Delta_k\}. \tag{0.9} \text{ ?\underline{eq:xaddn}?}$$

$$\mathsf{S} = \mathbb{1}(\|x_k^{\mathrm{a}} - \overline{\mathcal{X}_k}\| < \rho_k/2), \tag{0.10} \text{ ?\underline{eq:shortd}?}$$

$$\mathsf{R} = \mathbb{1}(\mathsf{S} = 1 \text{ and the errors in recent models are small}). \tag{0.11} \text{ ?\underline{eq:redrho}?}$$

If $\mathsf{R} = 1$, then let $\mathcal{X}_{k+1} = \mathcal{X}_k$, $Q_{k+1} = Q_k$, and go to step 4. If $\mathsf{R} = 0$ and $\mathsf{S} = 1$, then set $\Delta_{k+1} = \max\{\Delta_k/10, \rho_k\}$. If $\mathsf{S} = 0$, then evaluate $r_k = [f(\overline{\mathcal{X}_k}) - f(x_k^{\mathrm{a}})]/[Q_k(\overline{\mathcal{X}_k}) - Q_k(x_k^{\mathrm{a}})]$ and update Δ_k to Δ_{k+1} according to r_k.

2. **Interpolation set update**. Let

$$x_k^{\mathrm{d}} \approx \mathrm{argmin}\{\kappa(\mathcal{X}_k \cup x_k^{\mathrm{a}} \setminus x) : x \in \mathcal{X}_k\}. \tag{0.12} \text{ ?\underline{eq:xdropn}?}$$

If $\mathsf{S} = 0$ and either $r_k > 0$ or $\kappa(\mathcal{X}_k \cup x_k^{\mathrm{a}} \setminus x_k^{\mathrm{d}}) \leq \kappa_0$, then set

$$\mathcal{X}_k^+ = \mathcal{X}_k \cup x_k^{\mathrm{a}} \setminus x_k^{\mathrm{d}}, \quad Q_k^+ = \mathrm{P}^{\mathrm{s}}_{\mathcal{Q}_k^+}(Q_k); \tag{0.13} \text{ ?\underline{eq:updateq1}?}$$

otherwise, $\mathcal{X}_k^+ = \mathcal{X}_k$ and $Q_k^+ = Q_k$.

3. **Geometry improvement**. Let $\Delta_k^+ = \max\{\min\{\delta(\mathcal{X}_k^+)/10, \Delta_{k+1}/2\}, \rho_k\}$, and

$$y_k^{\mathrm{d}} = \mathrm{argmax}\{\|y - \overline{\mathcal{X}_k^+}\| : y \in \mathcal{X}_k^+\}, \tag{0.14} \text{ ?\underline{eq:ydropn}?}$$

$$y_k^{\mathrm{a}} \approx \mathrm{argmin}\{\kappa(\mathcal{X}_k^+ \cup y \setminus y_k^{\mathrm{d}}) : \|y - \overline{\mathcal{X}_k^+}\| \leq \Delta_k^+\}. \tag{0.15} \text{ ?\underline{eq:yaddn}?}$$

If $\delta(\mathcal{X}_k^+) \geq 2\Delta_{k+1}$ and either $\mathsf{S} = 1$ or $r_k < 1/10$, then set

$$\mathcal{X}_{k+1} = \mathcal{X}_k^+ \cup y_k^{\mathrm{a}} \setminus y_k^{\mathrm{d}}, \quad Q_{k+1} = \mathrm{P}^{\mathrm{s}}_{\mathcal{Q}_{k+1}}(Q_k^+); \tag{0.16} \text{ ?\underline{eq:updateq2}?}$$

otherwise, $\mathcal{X}_{k+1} = \mathcal{X}_k^+$ and $Q_{k+1} = Q_k^+$. If $\delta(\mathcal{X}_k^+) < 2\Delta_{k+1}$, $\max\{\Delta_{k+1}, \|x_k^{\mathrm{a}} - \overline{\mathcal{X}_k}\|\} \leq \rho_k$, and either $\mathsf{S} = 1$ or $r_k \leq 0$, then set R to 1.

4. **Resolution enhancement**. If $\mathsf{R} = 1$, then reduce ρ_k by about a factor of 10 to obtain ρ_{k+1}, and set $\Delta_{k+1} = \max\{\rho_{k+1}/2, \rho_k\}$. If $\mathsf{R} = 0$, then set $\rho_{k+1} = \rho_k$.
